INTRODUCTION

Background & Objectives

For 2022 the Suicide Prevention Resource Center commissioned The Harris Poll to conduct a nationally representative sample of U.S. adults in order to….

Assess the public’s knowledge about suicide and the role they may play in being there for someone who is struggling or in crisis.

Uncover the public’s perception of barriers that may prevent individuals from trying to help someone at risk for suicide.

Understand the public’s usage, expectations, and barriers to using crisis services. As well as, taking a pulse on public awareness of 988.

Explore changes in knowledge and attitudes and assess the impact of unified suicide prevention messaging efforts over time since the baseline research was conducted in 2018.
INTRODUCTION

Research Method

**Mode:**
Online survey

**Length:**
28 questions

**Qualification Criteria:**
- US residents
- Adults Ages 18+

**Sample Size:**
n=2,054

**Field Dates:**
July 18 – 20, 2022

**Weighting:**
Data weighted to ensure results are projectable to U.S. adults ages 18+

**Method Statement** (*first paragraph must be included in all press materials):*

This survey was conducted online within the United States by The Harris Poll on behalf of SPRC and AFSP from July 18 - 20, 2022 among 2,054 U.S. adults ages 18 and older. This online survey is not based on a probability sample and therefore no estimate of theoretical sampling error can be calculated.

Figures for age within gender, region, race/ethnicity, household income, education, marital status, and size of household were weighted where necessary to align them with their actual proportions in the population. Propensity score weighting was used to adjust for respondents' propensity to be online.

All sample surveys and polls, whether or not they use probability sampling, are subject to multiple sources of error which are most often not possible to quantify or estimate, including sampling error, coverage error, error associated with nonresponse, error associated with question wording and response options, and postsurvey weighting and adjustments. Therefore, The Harris Poll avoids the words “margin of error” as they are misleading. All that can be calculated are different possible sampling errors with different probabilities for pure, unweighted, random samples with 100% response rates. These are only theoretical because no published polls come close to this ideal.

Respondents for this survey were selected from among those who have agreed to participate in Harris Poll surveys. The data have been weighted to reflect the composition of the adult population. Because the sample is based on those who agreed to participate in panels, no estimates of theoretical sampling error can be calculated.

The 2020 research was conducted utilizing the same research method among n=2,072 US Adults between July 22 - 24, 2020 – similar to the 2018 research among n=2,015 US Adults between August 28 - 30, 2018. No edits were made to the trended questions between 2018 and 2020. Statistically significant year-over-year differences are indicated with capital letters throughout: A (2022), B (2020), C (2018)
Executive Summary
EXECUTIVE SUMMARY

Personal Experience with Mental Health and Suicide

More than in 2020, the majority of U.S. adults today have at some point thought they might have a diagnosable mental health condition. The majority are doing something right now to cope with our support their mental health and well-being right now, but even the top strategies (sleep, healthy food, exercise) aren’t being used by a majority.

• The majority of U.S. adults (67%) have at some point thought they might have a mental health condition, on the rise significantly from 2018-20 (57-60%), most commonly anxiety (48%) or depression (41%),
  • About 1 in 4 U.S. adults (26%) have personally thought about or attempted suicide.
• Right now, the majority of adults (88%) are doing something to cope with or support their own mental health, primarily getting enough sleep (45%), eating healthy (44%), and exercising (41%).

Most adults also have personal experience – increasing from previous years – with someone who has thought about or attempted suicide.

• Higher than in 2018 and 2020 (53-55%), a slight majority of U.S. adults today (59%) have familiarity with suicide; either knowing someone who has died by suicide (33%), have talked to someone about thoughts of suicide (26%), worrying about someone that may have been contemplating suicide (24%), or knowing someone who has attempted suicide but didn’t die (24%).
EXECUTIVE SUMMARY

Personal Services and Mental Health Support

While mental and physical health are seen as equally important personal concerns, most adults do not feel they are treated equally in reality within the overall health care system.

- Thinking about their own health, most U.S. adults (76%) think that mental health and physical health are equally important. For those who don’t, mental health (16% vs 8% for physical health) is twice as likely to be seen as most important – and has grown in priority since 2018 (11% mental health; 9% physical health).
  - That said, just over half of U.S. adults (51%) believe that physical health is treated as more important than mental health in the current health care system.

Most U.S. adults feel confident that they know where to turn in the event of a mental health or suicide related crisis. A mental health provider remains the #1 resource for coping and support. However, most resources (including HCPs, hotlines, family, faith leaders) are being tapped more than they were in previous years.

- Nearly 3 in 4 U.S. adults (73%) say they know where to reach out for help if they or someone they know is experiencing a mental health or suicide related crisis.
- A mental health provider is the most trusted resource (56%) and top place (57%) that U.S. adults would turn to obtain helpful resources or tips about coping with thoughts of suicide or helping a loved one who might be struggling with thoughts of suicide.
  - Family/friends (45%, 52%), a doctor or other primary care health professional (43%, 49%) and a hotline/crisis line (38%, 46%) are the next choices respectively.
EXECUTIVE SUMMARY

Personal Services and Mental Health Support (Continued)

Seeing a mental health professional is perceived to be a sign of strength, but tangible barriers (like cost, knowledge and access) are viewed to stand in the way. While cost has declined somewhat as a barrier, emotional feelings of despair, hopelessness, and embarrassment remain key obstacles to overcome for those who could use help. U.S. adults identify a variety of ways to improve the strategies for suicide prevention, in particular more professional education, greater access to care, and improved public health campaigns.

- Just over half of U.S. adults (53%) feel that seeing a mental health professional is a sign of strength.
  - However, like in the past, around one-quarter to one-third continue to think it’s something most people cannot afford (32%), don’t know where to find (32%), or is inaccessible to most people (24%).
  - According to U.S. adults, the biggest barriers that prevent people who are thinking about suicide from seeking help are: feeling like nothing will help (70%), lack of hope (66%), embarrassment (59%), and not knowing how to get help (56%). Cost is a lower barrier than in 2018 (55% vs 46% today).
- To help reduce the number of people who die by suicide, most U.S. adults point to more training and education for professionals (78%); greater access to care (77%); and educating the public about suicide prevention (60%).

Most U.S. adults would feel comfortable contacting a crisis line if needed and would expect a trained professional to respond. Currently, there is lukewarm familiarity with both the National Suicide Prevention Lifeline and the new 988. But once described, adults see the benefits of 988 and say they would be likely to take advantage of it; the top obstacles to overcome include stigma, cost, and lack of confidence in the local services.

- Nearly 3 in 4 (73%) would feel comfortable contacting a crisis line. If they called a crisis line for themselves or someone they know who was experiencing a mental health or suicide related crisis, most U.S. adults would expect a trained mental health provider or mobile crisis team (86%), a medical professional or ambulance (66%), or police or law enforcement would respond (64%).
- More than 1 in 10 (13%) have personally used a suicide prevention hotline.
- Just over half of U.S. adults (53%) are at least somewhat familiar with the National Suicide Prevention Lifeline, but only 21% are very familiar.
- A majority (57%) have heard of 988, the new dialing, texting, and chat codes for individuals in the U.S. experiencing a suicide or mental health-related crisis, but only about one-quarter have any real knowledge of it (17% somewhat familiar, 11% very familiar).
  - Once it’s described to them, about 8 in 10 (81%) say they would be somewhat likely (42%) or very likely (39%) to use 988.
  - U.S. adults say they would access 988 for a variety of reasons. At the top of the list are: they/someone they know struggling with thoughts of suicide (70%); they/someone they know experiencing a mental health crisis (69%). They are less inclined to use it for substance abuse issues (39%).
- The top barriers that would prevent U.S. adults personally for reaching out to crisis services if they were struggling with thoughts of suicide or mental health distress include: fear of what others would think (39%); fear of out of pocket costs (26%); and lack of confidence in the services in their area (25%).
EXECUTIVE SUMMARY

Dialogue around Mental Health and Suicide

A slight majority of U.S. adults feel comfortable talking to others about mental health and suicide – both privately and publicly, with professionals and loved ones, about their own experiences and others. However, adults vary substantially on who specifically they would turn to if they personally were having thoughts of suicide.

• Half to three-quarters of U.S. adults are at least somewhat comfortable:
  • talking to a clinician (primary care doctor, mental health professional) if they have or are struggling with thoughts of suicide (71%)
  • talking to a friend or loved one if they have or are struggling with thoughts of suicide (65%, up from previous years)
  • discussing suicide with their friends and loved ones (62%)
  • talking openly in public about mental health (61%)
  • talking openly in public about suicide (51%)

• If they personally were having thoughts of suicide, most U.S. adults (80%) would tell someone, even more so than in 2018 and 2020 (both at 73%). However, like in previous years, there is little consensus on who that person would be, again split nearly evenly between a mental health provider (40%), family member other than their spouse (38%), a friend (37%), or their spouse or significant other (36%).

Open dialogue about mental health is widely seen as “brave.” However, there are still some barriers that continue to inhibit the discussion around suicide, in particular lacking the right knowledge or language on exactly what to say.

• When people talk openly about their mental health, most U.S. adults (57%) feel they are being brave and rarely view this discussion as uncomfortable (8%); too personal (7%); or that they are just complaining (6%).
• That said, most U.S. adults today (69%, higher than in 2018) say something would prevent them from talking about suicide with others, in particular not knowing the right words to say (29%) and not feeling like they have enough knowledge (27%).
# EXECUTIVE SUMMARY

## Public Prevention and Action

Suicide is often considered preventable at least sometimes; and a growing number of adults believe there are indications ahead of time, and a large majority feel that action can be taken to try to help.

- Nearly universally, U.S. adults (94%) believe that suicide can be prevented at least sometimes. Over half (52%) think it can be avoided often or all the time, rising over the years from 2018 (44%) and 2020 (47%).
- Three-quarters of U.S. adults (75%, higher than what has been reported in previous years) say that most people who die by suicide usually show some signs beforehand.
- Only about one-fifth (21%) believe that if someone wants to die by suicide, there is nothing anyone can do to help them.

While mental health professionals are the top resource people would suggest if a loved one was struggling with mental health, they are not seen as the only source of support. Faith leaders are also perceived to be a potentially valuable ally and most adults feel increasingly comfortable themselves (though still not very comfortable) being there for a loved one with thoughts of suicide. That said, barriers to support and communication remain, in particular concerns about the possibility of making matters worse.

- If they were worried about the mental health of someone they knew, nearly everyone (94%) would take action, up from 2018 and 2020 (90-91%). Most commonly they would encourage that person to seek help from a mental health professional (60%) and offer to listen to their concerns (52%).
  - Likewise, almost universally, adults (96%) would do something if someone close to them were thinking about suicide, encouraging the person to seek help from a mental health professional (61%), offering to listen to the person’s concerns (54%), or calling a crisis hotline/encouraging them to do so (54%).
- Most adults (83%) believe that faith leaders can also play a role in suicide prevention.
- Less than 2 in 5 U.S. adults (38%) feel that only clinical professionals (e.g. doctors, mental health professionals) can help someone who is thinking of suicide.
- Over three-quarters of U.S. adults (78%) are at least somewhat comfortable being there for or helping a loved one who might be struggling or having thoughts of suicide. But, only 36% are very comfortable.
  - There are some clear barriers that might stop U.S. adults (67%, higher than in previous years) from trying to help someone close to them who was thinking about suicide, including: being afraid that they would make the person feel worse (29%), not being the right person/thinking someone else might be better (25%), or being afraid that talking about it would increase the person’s likelihood of attempting suicide (24%).

About 1 in 3 adults feel they have enough knowledge to tell if someone is considering suicide. That said, over 8 in 10 are interested in learning how they might be able to help.

- Just over one-third of U.S. adults (36%) say they can tell when someone is suicidal.
- A large majority (83%, higher than in 2018 or 2020) remain interested in learning how they might be able to play a role in helping someone who may be suicidal.
EXECUTIVE SUMMARY

Mental Health Support During Covid

Since the start of the pandemic, most adults feel they have become more empathetic and increasingly open to talking about mental health. Due to the pandemic, most U.S. adults have become more aware of the importance of taking care of their own mental health, yet 1 in 2 have found it even more difficult to get the care they need.

• About 7 in 10 (69%) believe that COVID-19 has made them a more empathetic person.
• A majority (61%) say that since the start of the COVID-19 pandemic, they have become more open to talking about mental health (even more than in 2020, 52%).
• Since the start of the pandemic, a large majority (81%) have become more aware of the importance of taking care of their own mental health, on the rise since 2020 (73%).
• Half (50%) have found it is more difficult to access the mental health care they need in the wake of the pandemic.

According to a growing number of adults, the COVID-19 pandemic has shone a light on the importance of making suicide prevention a national priority. The U.S. public generally believes that the media and entertainment industry has a role in mental health and suicide prevention, particularly around education. However, a substantial minority also criticize the media for exaggerating the mental health crisis.

• More than 8 in 10 U.S. adults (84%, up since 2020 at 81%) say that as a result of the pandemic, it's more important than ever to make suicide prevention a national priority.
• Almost all adults (87%) believe that the media and entertainment industry play some role in mental health and suicide prevention, especially in educating people about available assistance programs (52%).
  • However, nearly 4 in 10 (38%) feel the media exaggerates the nation's mental health and suicide crisis.
Detailed Findings
Personal Experience with Mental Health and Suicide
Depression And Anxiety Continue to be Most Common Mental Health Issues

Self reported mental health conditions have been steadily increasing since 2018.

PERSONAL EXPERIENCE WITH MENTAL HEALTH AND SUICIDE

BASE: QUALIFIED RESPONDENTS 2022 (n=2054), 2020 (n=2072), 2018 (n=2015)

Q10 Considering your own health, do you think that mental health or physical health is more important, or are they equally important?

Q15 Which of the following best describes how you think the importance of mental health and physical health are treated in our current health care system?
MENTAL HEALTH BELIEFS

There is Strength in Seeing a Mental Health Professional, But It’s Seen as Largely Inaccessible

More than half see it as sign of strength, yet around a third feel it is something most people cannot afford or something they do not know where to find – and around a quarter say it is not accessible for most people.

Seeing A Mental Health Professional Is...

- A sign of strength
- Something most people can't afford
- Something people do not know where to find
- Not accessible for most people
- A last resort
- A sign of weakness
- Not as good as seeing a faith leader (e.g., minister, pastor, priest, rabbi, imam)
- Ineffective
- Not necessary because people should stand on their own
- Not acceptable for someone like me*

*New statement in ‘22

Q215 How much do you agree or disagree with each of the following statements about the COVID-19 pandemic?

^Question revised in '22
Beliefs Around Suicide
I would be interested in learning how I might be able to play a role in helping someone who may be suicidal.

Faith leaders (e.g., minister, pastor, priest, rabbi, imam) can play a role in suicide prevention.*

Most people who die by suicide usually show some signs beforehand.

Only clinical professionals (e.g. doctors, mental health professionals) can help someone who is suicidal.

I can tell when someone is suicidal.

If someone wants to die by suicide, there is nothing anyone can do to help them.
BELIEFS AROUND SUICIDE

Vast Majorities Continue to Believe Suicide Can Be Prevented at Least Sometimes

About half (52%) feel it can be prevented all the time or often.

Q60 Do you think suicide can be prevented...?
Beliefs Around Suicide

Emotion and Accessibility Barriers are Believed to Keep People Thinking about Suicide From Seeking Help

Feelings of hopelessness & embarrassment top the list; however, many cite access barriers such as not knowing how to get help, inability to afford treatment, and lack of access to treatment.

Perceived Barriers Preventing People who are Thinking about Suicide from Seeking Help

- Feeling like nothing will help
- Lack of hope
- Embarrassment
- Not knowing how to get help
- Lack of social support
- Fear of disappointing others
- Social stigma
- Can’t afford treatment
- Lack of access to treatment
- Fear of losing a job
- Other

Q140 Which of the following would prevent you from talking about suicide with others? Please select all that apply.
Coping with Suicide
COPING WITH SUICIDE

Most Would Encourage Seeking Help or Offer to Listen If Worried About Someone’s Mental Health

Many actions more commonly selected in 2022 compared to 2020.

94% Would do something if they were worried about someone’s mental health (90% ‘20, 91% ‘18)

60% Encourage them to seek help from a mental health professional (54% ‘20, 58% B ‘18)

52% Offer to listen to their concerns (47% ‘20, 52% B ‘18)

44% Encourage them to seek help from a doctor or primary care health professional (46% ‘20, 47% ‘18)

41% Tell them I am worried about them (40% ‘20, 45% AB ‘18)

Help them make/take them to an appointment

Stay with them until they could get help

Offer to help them with everyday tasks to support them while they manage the crisis

Talk with their friends or family about your concerns

Encourage them to call a crisis hotline *

Provide them with a phone number for a crisis hotline or other resource

Encourage them to seek help from a mental health professional (e.g., minister, priest, pastor, rabbi, imam)

Recommend a mental health app (e.g., Talkspace, Headspace, etc.) *

Tell them everything will be ok

Visit a website for information

Call a crisis hotline myself

Take them to the emergency room (ER)

Call 9-1-1

Report them through a social media suicide prevention reporting function

Leave them alone

^New question in ‘22
Two Thirds Report A Barrier to Reaching Out to Crisis Services

Common barriers range from cost/insurance coverage, to fear of what family/friends/others will think, to a lack of confidence that services can help or that police will respond.

Say nothing would prevent them from reaching out

Report at least one barrier would prevent them from reaching out

Top Barriers to Reaching Out to Crisis Services

- Fear of out-of-pocket costs associated: 26%
- Fear of what my family would think: 26%
- Lack of confidence that services in my area are able to help: 25%
- Fear of police/law enforcement responding: 24%
- Lack of insurance to cover costs associated: 24%

Additional Barriers

- Fear of what my friends would think: 23%
- Fear of what others would think: 21%
- Fear of losing my job if someone found out: 15%
- Lack of transportation to get to services: 14%
- Lack of culturally competent care: 14%
- Negative past experiences reaching out to crisis services: 11%
- Other: 3%

Expectations and Awareness of Crisis Lines/Services

Q325 Which of the following would prevent you from reaching out to crisis services if you were struggling with thoughts of suicide or experiencing mental health distress? Please select all that apply.

^New question in ‘22
Most Have at Least Heard of the National Suicide Prevention Lifeline

But only about half are familiar and just ~1 in 10 have ever used a suicide prevention hotline.

**Familiarity with the National Suicide Prevention Lifeline^**

- 91% At least heard the name
- 53% Familiar
  - Very familiar
  - Somewhat familiar
  - Just heard the name
  - Never heard of it

**Personal Use of a Suicide Prevention Hotline^**

- 85% Have never personally used a suicide prevention hotline
- 13% Have ever personally used a suicide prevention hotline
- 2% Declined to answer

*BASE: QUALIFIED RESPONDENTS 2022 (n=2054)*

Q330 How familiar are you with the National Suicide Prevention Lifeline?
Q335 Have you ever personally used a suicide prevention hotline?
Few are Familiar With 988, But After Being Told About it, Most Say They Are Likely to Reach Out if They or Someone They Know Needed Help

More than 2 in 5 have never heard of 988.

**Familiarity with 988**

- 57% At least heard the name
- 28% Familiar
  - Very familiar
  - Somewhat familiar
  - Just heard the name
  - Never heard of it

**Likelihood to Reach Out to 988**

- 81% Likely
  - Very likely
  - Somewhat likely
  - Not very likely
  - Not at all likely

- 19% Not likely
  - Very likely
  - Somewhat likely
  - Not very likely
  - Not at all likely

**BASE: QUALIFIED RESPONDENTS 2022 (n=2054)**

Q340 How familiar are you with 988, the new dialing, texting, and chat codes for individuals in the U.S. experiencing a suicide or mental health-related crisis?

Q345 As you may know, 988 is a three-digit dialing code that will allow users to call, text or chat with trained counselors at the National Suicide Prevention Lifeline network about a suicidal, mental health or substance use crisis. This line became available nationwide in July of this year. How likely would you be to reach out to 988, if you or someone you knew needed help?

^New question in '22
Adults Are Most Likely to Reach Out to 988 if Someone They Know is Having Thoughts of Suicide or Experiencing a Mental Health Crisis

They are slightly less likely to say they would do the same if they themselves were experiencing these things. 988 is less likely to be used when people are experiencing substance abuse issues.

**Expectations and Awareness of Crisis Lines/Services**

Adults are most likely to reach out to 988 if someone they know is having thoughts of suicide or experiencing a mental health crisis. They are slightly less likely to say they would do the same if they themselves were experiencing these things. 988 is less likely to be used when people are experiencing substance abuse issues.

### Situations Would Reach Out to 988 For

- **Thoughts of suicide**: 70%
- **Mental Health Crisis**: 69%
- **Substance Abuse Issues**: 39%

### Other

- **Other**: 3%
- **None – I would not be likely to reach out to 988 for anything**: 13%
